Course Description

This course explores the dynamics of ecological systems, and considers the interactions between individual organisms and populations, organisms and the environment, and ecological processes. Four dominant themes are explored: interactions, evolutionary ecology, the nature of communities, conservation, and management. Emphasis is placed on the quantitative methods in ecology, including sound planning and experimental designs, and on the role of ecological science in the conservation, management, exploitation, and control of populations. Relevant case studies of ecological processes are drawn from marine, freshwater, and terrestrial systems, with plants, animals, fungi, and other life forms.

Language(s) of Instruction

English
