#### **Course Description**

In this course, students investigate fundamental aspects of environmental economics with particular reference to the problem of climate change. Topics include fundamental concepts (e.g. externalities, the environment, sustainability); the relationship between pollution, economic growth, and population change; the future costs of climate change for economies and societies vs the costs of reducing emissions; the economics of climate resilient development; and climate science and climate policy (e.g. myths and realities, uncertainty, and international agreements).
