6.00

**UCEAP Semester Units**

4.00

## Course Description

This course provides an introduction to the relationship between brain and behavior. The course focuses on key questions such as: organization of the brain, effects of drugs on human behavior; sight, hearing, movement production, and the brain involvement. The course integrates clinical topics, such as Parkinson's disease and schizophrenia, examines fMRI research methods and findings, and emphasizes the key principles of nervous system function. Although no background knowledge is required other than an introductory psychology course, an interest in biological bases of behavior or neuroscience is helpful.
