Course Description

This course introduces some of the diverse topics around sustainability and the future of the environment. The focus in the first half of the course is to identify and explore various global issues that currently need to be addressed to ensure sustainability. Topics such as population, migration, health, cities, water, food, and the digital age are included. Economic and biological aspects are not covered in any depth even though they too are complementary and equally essential in providing robust ways forward. Any student with interests in these areas would be warmly welcome to participate and to contribute. The second half of the course focuses on the need to provide sustainable energy, and alternative energy sources are introduced since decisions currently are being, and will need to continue to be, taken to replace conventional fossil fuels.
