Course Description

The course provides an overview of research in behavioral economics, a field of economics that draws on knowledge in psychology to capture important aspects of human behavior and social interactions that standard economic models cannot explain. Topics include heuristics and biases, decision making under uncertainty, prospect theory, reference dependence, intertemporal choice, social preferences, bounded rationality, as well as nudges. Throughout this course, students link theory to practice and discuss empirical applications in areas and topics such as consumer choice, saving behavior, procrastination, education, labor supply, finance, and policy making.
