UCEAP Semester Units

4.00

Course Description

This course explores the ways in which psychology allows us to understand the mechanisms behind the choices we make – including situations such as addiction, where people seem to have a reduced ability to choose. Across a series of lectures and seminars, students see how varied the approaches to this topic area can be, taking in attempts to measure the degree to which an action is freely willed, analysis of choices in terms of expected outcomes, the influence of environments (physical, informational and social) on your choices, habitual choices where we may not be aware of making them, and addiction to both substances and gambling, where people's short-term choices may directly conflict with their longer-term aims. Students learn how information from a range of approaches can be integrated to develop our understanding of the topic. In addition, through a series of practical sessions students design, implement, and report a novel piece of research on choice behavior.
