UCEAP Semester Units

3.00

Course Description

Intelligent vehicles can communicate with other vehicles or roadside units and behave autonomously. They are believed to significantly change the way that people move from one place to another. This class introduces fundamental knowledge in intelligent vehicles and then focuses on some specific advanced topics (e.g., security). The knowledge and topics bring state-of-the-art technology to students and develop their skills in system modeling, design, and analysis.

There are mainly four parts in this class:

(1) Background: This part introduces traditional (i.e., without connectivity and autonomy) system architecture, vehicular networks, and basic design and analysis approaches.

(2) Applications: This part introduces applications of intelligent vehicles, including advanced driver-assistance systems, cooperative adaptive cruise control, and intersection management.

(3) Technology: This part introduces the technology which is needed to realize the applications of intelligent vehicles.

(4) Advanced Topics: This part introduces advanced topics such as over-the-air update, security, and certification.

Depending on students' interests, final projects can be survey, implementation, or research.
