UCEAP Semester Units

8.00

Course Description

This course is an advanced biology course providing an understanding of the fate, uptake, and effects of anthropogenic pollutants in the environment. Students study and apply ecotoxicological theories, models, and common methods and approaches concerning the fate of pollutants in the environment using fugacity-based multimedia partitioning models, uptake and accumulation using models of bioconcentration and biomagnification, and effects on different levels of biological organization (cellular, organism, population, and ecosystem) using ecotoxicological test methods with different endpoints.
