6.00

**UCEAP Semester Units**

4.00

## Course Description

This lecture-based course integrates theories and practices of environment and society as reflected in contemporary governance debates. The course explores the science and politics of environmental governance, examining the historical and contemporary practices by which human uses of natural resources have been governed. It analyses the knowledges, models, and theories that make up scientific understandings of biodiversity conservation, particularly participative and economic concepts and rationales. Through these areas, and drawing upon debates from various literatures, the course critically interrogates the ways in which human uses of natural resources in protected areas are considered as governable.
