Course Description

This course discusses topics including a general framework and short historical overview of affective neuroscience; features and functions of some fundamental brain areas/structures involved in emotional processing; research methods in affective neuroscience: strengths and limitations of animal models and neuroimaging techniques; the neural basis of fear, reward, and aggression; and the neural networks implicated in anxiety disorders, depression, and psychopathy. This course requires knowledge of the structure and functions of central and peripheral nervous system, and on general psychopathology, as a prerequisite.
