UCEAP Semester Units

Course Description

This skills course allows students to obtain a basic introduction to techniques and methods in modern Genetics. The first skills take place at a designated skills laboratory at Chemelot campus; subsequent skills training topics "Genomes and Genomics" are taught in a computer landscape. These days integrate theoretical and practical information. Each student receives theoretical and practical in silico training in the morning, followed by a limited number of tasks to execute on the computer and answered in a skills report. The final skills consist of a student group presentation where the combined theoretical and practical skills on Genetics are applied to a pre-assigned task. This skills course covers the following: procedures to purify genomic DNA from eukaryotic cells and plasmid (circular) DNA from prokaryotic cells and perform quantitative analyses on each product; polymerase chain reaction (PCR) analysis; analysis of DNA products using restriction digestion, ligation and agarose gel electrophoresis; isolation of RNA from eukaryotic cells and apply reverse transcription to generate copy DNA; Western immunoblotting; genetic and genomic websites, general and specialized databases, and relationships of genes within and between databases; technical training for more advanced skills in molecular biology and the life sciences. Prerequisite for this course is Cell Biology.
