#### **Course Description**

This course examines discrete time option pricing models in a mathematical way. The course is composed of three sections. In the first section, one-period binomial models are discussed. In particular, topics cover how to price options, and the meaning of some important terminologies in option pricing theory, arbitrage, replicating strategy, market completeness and so forth. Next, we extend one-period models to multi-period models. In particular, we discuss pricing of American options. The last section studies general one-period models to show the fundamental theorems of option pricing using some results on linear algebra. All students in this class are supposed to be familiar with calculus, linear algebra and the basic of probability theory.
