Course Description

The UN has defined seventeen sustainable development goals. At least half of these (e.g. clean water and sanitation, affordable and clean energy, industry, innovation and infrastructure, responsible consumption and production, climate action, life below water, life on land, no poverty and zero hunger, and sustainable cities and communities) have implications for how society exploits Earth's finite resources (e.g. energy, freshwater, minerals, soils, and metals). This course provides geoscience and earth systems perspectives on the opportunities, limitations, and challenges that are likely to arise from the implementation of the UN Sustainable Development Goals.
