**UCEAP Quarter Units**

3.00

**UCEAP Semester Units**

2.00

## Course Description

This course provides an understanding of the workings of an international macroeconomic model, and examines, by the model, how changes in international economic conditions affect the exchange rate, the interest rate, and the output. The course provides an international macroeconomic model developed in Krugman et al. (2011). Students construct three models: a model describing the exchange rate determination in the FX market, a model of asset market describing the interest rate behavior, and a model of goods market, where the national output is determined. Later students integrate the three models into one and describe the “simultaneous” determination of these variables. Assessment: midterm exam, final exam, and quizzes.
