Course Description

Most psychology subjects learn what is found in various areas of psychology: perception, clinical, social, personality, development, and industrial psychology. However, this subject focuses on how rather than what. Through the process of thinking and discussing how to do various psychology studies together, we lay the foundation for psychology as a science. The goal of this class is to provide scientific access to a variety of psychological questions and to help people with ethical, critical, and creative qualities. More specifically, through this class, you learn the kinds of psychological research methods, the special benefits and limitations of each method, the tricks and limitations of experimental design and the concepts that are generally needed to be considered, how to interpret the results of the experiment, and how to write a report. Students also have a chance to ask themselves a psychology question and to study it in detail to answer it.
