Course Description

This course serves as a starting point in which students develop basic programming skills and obtain a much better understanding of what programming entails. The ability to program or at least to understand how programming works and what it can do is very important for approaching most if not all global challenges of today, be it climate change, crisis management, tackling health issues, or fighting poverty and discrimination, because programming enables the use of available data and tools to recombine them into useful, specific applications that help people to make better informed decisions. The course starts with the basics of programming using the programming language Python. Python is relatively simple and concise compared to other programming languages and students interactively explore it and try to reach a level where they can set up little programs, defining their own projects.
