Course Description

This course focuses on seeing the different facets of the mobility of the land-sea boundary. In the first part of the course, students learn the definition of the littoral (coastlines) according to different disciplines (biology, geography, and ecology) and analyze a variety of problems that arise in coastal planning and conversation. The second part of the course focuses on coastal forces such as variations of the global sea level, coastal dynamics, and types of coastlines (processes, different forms, reefs). This part of the course includes a variety of exercises aimed at understanding the different scales of time and space regarding coastal systems. In the third part, the issues of coastal mobility are tackled by the analysis of policies and planning techniques (MIACA, MIALR, littoral law, PPRL, defense works, strategies in other countries). Finally, in the fourth period, it is a question of the littoralization and the stakes to come with tourism of the littorals, the retreat of the coastline on the low coasts, the mangrove, the coral reefs, etc.
