## **UCEAP Quarter Units**

4.50

#### **UCEAP Semester Units**

3.00

## **Course Description**

This course covers a method to establish causal relationships in non-experimental data, called "Instrumental Variables". The course covers panel data, that is, data which tracks individuals over time. It also covers situations when outcome data is discrete in nature, such as "subject I chose option A (and not B)". A range of simple machine learning methods are discussed which are helpful for classification and prediction tasks. Crucially, the course has a maximum focus on hands-on practice, minimal importance to the derivation of formal results.
