Course Description

The discipline of statistics is concerned with situations in which uncertainty and variability play an essential role and forms an important descriptive and analytical tool in many practical problems. Against a background of motivating problems, this course develops relevant probability models for the description of such uncertainty and variability. Topics: sample spaces; operations of events; probability and probability laws; conditional probability; independence; discrete random variables; cumulative distribution function; probability mass function; Bernoulli, binomial, geometric, and Poisson distributions; continuous random variables; probability density function; exponential, gamma, and normal distributions; functions of a random variable; joint distributions; marginal distributions; independent random variables; functions of jointly distributed random variables; expected value; variance and standard deviation; covariance and correlation.
