Course Description

Perception is central to our daily interactions with the world. We can effortlessly navigate through a city, comprehend fast movie trailers, and find a friend in a crowd through visual and auditory perception. While we take the rich perceptual experience for granted, visual perception involves a series of complicated cognitive processes beyond just opening our eyes. This course introduces the field of perception, with special emphasis in vision, and examines the existing theoretical frameworks and recent research findings in the field. The course explores how we see the visual world; if we can see and remember correctly what is in the physical world; how many items we can keep track of and remember at a time; how the visual system is structured and what the neural mechanisms are that underlie visual perception. Assessment: Midterm (30%), Final (30%), Term paper (20%), Reading Quizzes (10%), Research Credit (5%), Attendance (5%).
