**Course Description**

This course familiarizes students with the theory and methodology of planning for urban quality of life. The course activities include theory lectures and a practical group assignment. The theory lectures focus on selected aspects of quality of life relevant to urban and regional planning. The group assignment focuses on analyzing and designing the regional spatial organization and building spatial scenarios for the future spatial development of a region. The assignment and related instruction lectures familiarize students with methods for prospective and projective scenario study. The methods and techniques are applied in the context of an urban region in the Netherlands. The overall planning task for the assignment is to develop an integrated spatial vision, scenarios, and strategies for the region for the long term (30 years) that can support the discussion about the future development of the region.  The assignment addresses some selected topics, while each group can choose its own focal issues. The main emphasis is on practicing methods and techniques for analyzing and designing spatial organization and building scenarios. The concepts for analyzing and designing the spatial organization of the area are provided in theory and instruction lectures. A study trip helps students to understand the context of the issues at hand.
