Course Description

This course on paleoecology provides a study of the different processes that have operated in ecosystems throughout the Quaternary Period and directly influenced the evolution and dynamics of populations. It examines the relationships between human beings and the environment throughout the Quaternary, considers the proximity of biotic communities of the past to present analogues, and explores how paleoecological conditions can be applied to current issues, such as climate change, the greenhouse effect, anthropogenic destruction of ecosystems, nature conservation, evolution of flora, and biodiversity.
