Course Description

This course highlights the evolution of organisms and the transition of evolutionary concepts into many (bio)technical applications. The emergence of evolutionary theory from Charles Darwin and Alfred Russel Wallace is examined, as well as the influence of Cuvier, de Lamarck, Matthew, Lyell, Malthus, Spencer, Wagner, Owen, Gould, and Bates. Fundamental biological and biochemical insight is imparted and assessed in the context of the theory of evolution. To that end, four different approaches are presented: in situ, in vivo, in vitro, and in silico experiments.
