UCEAP Quarter Units

8.00

UCEAP Semester Units

5.30

Course Description

This course offers a theoretical and practical study of the diversity of living organisms and the evolutionary forces that created it. The course examines the form and function of micro-organisms, animals, and plants in terms of their behavioral, physiological, and structural adaptations to habitat, and how these evolved. The course also covers genetics, and how organisms combat attacks from pathogens. Students study biological diversity; gain first-hand experience in the laboratory learning how to handle living organisms; and learn to observe and record accurately and make sensible deductions. There is a particular focus on scientific writing: how to use the scientific literature and assess biological data, how to explain what you have observed, and how to write in good scientific English.

Language(s) of Instruction
