## Course Description

The field of phonetics includes the study of how speech sounds are produced, how they may be acoustically characterized, and how they are processed by listeners. This course explores these three major areas of research, as well as introduces key areas in which phonetics intersects with other disciplines, e.g., phonology, language acquisition, sociolinguistics, psycholinguistics, computational linguistics, and speech-language pathology. The course covers the major instruments, software tools and statistical methods used in modern phonetics research, and provides experience in carrying out independent data collection, transcription, and acoustic analysis.
