Course Description

Climate change is one of the most important challenges we face. The effects of climate change vary over time and space, and are rooted in the operation and sensitivity of the climate system itself. This course first gives students a fundamental understanding of Earth's climate system and then investigates the history of climate on Earth and how (and why) climate changes over time. Students explore historical records of climate before turning their focus to future climate projections, including how models predict future climate scenarios.

Students also evaluate what implications future climate projections may have for communities both locally and globally.
