Course Description

The extraction, production, distribution and use of energy sources has significant environmental, social, political and economic impacts. Impacts are multi-scalar, ranging from global climate change to socio-cultural disruption at local, national and regional scales. This module exposes students to these impacts and related energy geopolitics with detailed case studies. The module also gives students a comprehensive background of the development and use of promising future post-carbon alternative energy sources such as wind, solar, geothermal, tidal, and biofuels. It discusses how to build the energy-efficient architecture of a low carbon economy and develop sustainable energy system design for the future.
