UCEAP Quarter Units

8.00

UCEAP Semester Units

5.30

Course Description

In this course, students cover contemporary safety and environmental concerns as they impinge on the practicing engineer, the legal and regulatory background to engineering activity, to ensure safe operation of hazardous processes, and the procedures to be followed in seeking a license from the environmental protection agencies for the operation of processes involving prescribed substances. Generation, propagation, and the fate of pollutants discharged to the air, to water, and to the ground are discussed along with means of mitigating emissions by elimination, substitution, and pre-discharge treatment are considered. Methods of identifying process hazards are introduced leading to risk assessment and consequence analysis using hand calculation methods are presented to allow risk assessment and its application to the process industries to be appreciated.
