UCEAP Semester Units

4.00

Course Description

The course covers topics on the patterns of inheritance, the molecular properties of genes and chromosomes, transcription and translation, genetic methods and technology, and genetic analysis of individuals and populations. This includes an in-depth understanding of Mendelian patterns of inheritance and variations that could occur due to multiple alleles, lethal genes, chromosomal variations, linkage, gene interaction and other genetic phenomena. Emphasis is placed on the understanding of the underlying molecular and biochemical basis of inheritance. Quantitative and population genetics are also discussed with the emphasis of understanding the processes and forces in nature that promote genetic change.
