PSYCHOPHYSIOLOGY

**UCEAP Transcript Title**

PSYCHOPHYSIOLOGY

**UCEAP Quarter Units**

7.00

**UCEAP Semester Units**

4.70

## Course Description

This course provides a systematic review of the basic principles, models, and methods of Psychophysiology research. The association between body and mind is scientifically analyzed by studying cognitive and emotional processes, and considering both physiological and behavioral variables, measured using electrophysiological and neuroimaging techniques. As much as possible, practical (brief) training sessions in the psychophysiology lab are carried out. The course discusses topics including an introduction to functioning principles and methodology of psychophysiological research; biosignal classification, and their application as marker of psychological processing; activation and resting state: peripheral and central (i.e., EEG and fMRI) indices; cognitive activation in healthy adults; and application of psychophysiological techniques to clinical research: evidence from studies on neurological and psychiatric patients. The course requires students to have an adequate knowledge of cognitive processes and anatomo-physiological bases of the central and peripheral nervous system as a prerequisite for the course.
