Course Description

This course is part of the Laurea Magistrale degree program and is intended for advanced level students. Enrolment is by permission of the instructor. This course explores the main theories, concepts, and approaches developed by social studies of science and technology (STS), and analytically compares them and discusses their pros and cons. The course examines basic issues about the materiality of and governance by data infrastructures, and their social and philosophical implications. Students develop experience in designing research on data infrastructures. Throughout the course, interactive moments are devoted to developing empirical research design skills, ranging from research question design to research methodologies. Such moments are finalized to support the STS research design to be submitted as part of the course assessment. The last week of the course focuses on data infrastructures and addresses some sociopolitical implications of data infrastructures. All topics are tackled by reading, presenting, and commenting on leading international literature and empirical case studies.
