3.30

Course Description

This course focuses on introducing students to the core concepts of the Unix operating system and how to program this system. Today, Unix and Unix-like operating systems are ubiquitous; they are widely used in servers, embedded devices and have a growing desktop and mobile market (Linux, Mac OS X, Android etc.). This course teaches students how to develop applications for such systems, assuming no other software layer but OS. Students improve their existing C programming language skills and learn some key POSIX APIs to support designing and writing programs in a portable, maintainable fashion. They learn how to write multithreaded and multi-process applications as well as some basics of Unix networking. This is done through the Unix command line, and students learn basic tools and how to write shell scripts to automate common tasks. Students need a version of Unix installed on their own laptop (ideally Linux), help with this is provided in the first lab.
