8.00

**UCEAP Semester Units**

5.30

## Course Description

This course uses general equilibrium models to study international trade, industrial structures, and structural change. The models are used to discuss and analyze the role of comparative advantage, trade, and productivity differences for industrial structures, resource allocation, and welfare. The course also provides a thorough introduction to game theory to analyze competition in markets with imperfect competition and strategic behavior between firms. It analyzes the impact of trade in markets with imperfect competition and how the gains from trade depend on market structures.
