### **Course Description**

This course addresses various topics in management research which encourage creative and logical thinking, structuring of clear arguments, and critical assessment of evidence. The intellectual backbone of the course is applied and empirical economics, including behavioral economics and finance, but wherever appropriate, the course discusses contributions from the psychology, sociology, and management literature. Students mainly deal with issues which are amenable to rigorous empirical investigation. Examples of questions considered are whether pain killers are more effective when they are expensive, whether successful entrepreneurs tend to have been juvenile delinquents, and gender differences in negotiation.
