## Course Description

This introductory course in macroeconomics teaches the insights of macroeconomic theory from a real-world perspective. The course combines chapters from the Blanchard textbook and units from the textbook *The Economy* to present a picture of contemporary macroeconomic problems and theories. The course starts with an introduction to key macroeconomic concepts, the use of models, the general equilibrium, and emerging properties. The second session focuses on economic fluctuations and the importance of multiplier effects. The next step is to analyze the importance and effects of fiscal policy. To provide a tool for analyzing the effects of policies, the wage and price setting model, and the Phillips curve are introduced. Special attention is given to the origins of inflation and the difference between supply and demand shocks. Next to fiscal policy, attention to monetary policy is given, after the role of the banking system in the economy is defined. The final session focuses on the specific problems that are related to the Eurozone countries; fixed exchange rates, the (non)optimal currency area, sovereign debt problems, and structural imbalances.
