**UCEAP Semester Units**

3.30

## Course Description

Students study memory systems, language comprehension and production, thinking and reasoning, problem solving, decision making and creativity as well as examples of applications of the contribution of these processes in understanding real-life applied situations (e.g. driving; food choices; navigating the environment; etc.). The applied settings also relate to perception and attention. Students learn how to describe the memory systems and demonstrate an understanding of speech and language production and comprehension. They explain thinking and reasoning and their fallacies. This course teaches students to describe and critically evaluate the contribution of cognitive psychology in explaining real-life situations.
