## Course Description

This course looks at the physiology of animals with a focus on human physiology. It involves lectures, lab work, and section work. The first part of the course is focused on the regulation of homeostasis in animals. It then studies the organization and function of the nervous system and the digestive system, with a close look at the contractile motion of the digestive tract, the secretions of the liver and pancreas, and the interplay with the nervous system. It finishes with an examination of thermoregulation and how metabolism plays a role in maintaining a stable body temperature.
