Course Description

This course introduces the basic concepts, analysis methods and related economic issues of individual economics. The scope of individual economics is mainly the consumption and production behavior of consumers and manufacturers in the market. In other words, it discusses the operation of demand and supply in the market and the determination of market prices. This course also explores the role of government departments in the market. For example, in the face of rising international crude oil prices, does the government need to control the rising prices of domestic oil products? Does the government charge tuition fees for college students, or regulate or subsidize it?

Through the analysis tools of individual economics, the course explores many issues of concern to the public, including public health, public health, poverty, unemployment, crime, education, marriage, childbearing, population aging, regulation, environmental protection, and international trade.
