UCEAP Semester Units

4.00

Course Description

The course examines the ecological and biological principles underpinning the major tropical marine ecosystems. It provides an understanding of the ecological processes that control tropical marine ecosystems, and considers the organisms that are characteristic of each. All the major tropical marine habitats are considered, but with a focus on coral reef, seagrass and mangrove ecosystems. The course also tackles topical research areas on the subject through student-led seminars, which vary depending on the latest scientific research and the specific interests of participants.
