Course Description

This course introduces Asian, European, and American material from the late nineteenth century to nearly the present day, concentrating on social and cultural themes such as industrialization, colonialism, science and race, technology and war, computers and global telecommunications and biotechnology and the human genome project. It is taught as a series of cases illustrating important events and multiple themes. The proposition that modern science and technology have been 'socially constructed', reflecting political and cultural values as well as the state of nature, is examined closely. The course includes theoretical material and an empirical focus.
