Course Description

This course focuses on past diets, adopting archaeological, ethnographic, historical, literary, linguistic, anthropological, and heritage studies perspectives. It discusses what diet did we evolve to eat, how technological development changed our dietary habits, what role food played in past cultures, how food-related decisions affected societies, what effects food globalization had on traditional diets, when subsistence activities started impacting environments, and what is human food and the omnivore's dilemma. Teaching introduces how we study food consumption in the past. The core of the course overviews the prehistory and history of foodstuffs and diets, as well as the issues arising from them. The concluding sessions focus on ongoing debates on food and diet, conducted in the light of the interdisciplinary approaches adopted in the course and through an understanding of dietary history.
