UCEAP Semester Units

2.70

Course Description

This course gives students an intuitive feel for the basic building blocks of analogue circuits. This course also teaches students how to analyze and design discrete and integrated CMOS based analogue circuits. Topics include MOS transistor model, linear and saturation regions, dc equations, MOS capacitances; small signal equivalent circuits and analysis; CMOS current mirrors, simple and cascode inverters, source follower plus differential amplifier circuits; differential amplifier circuits with gain and bandwidth of simple amplifiers; and use of LTSPICE for circuit simulation. (The course builds on material presented in the second year.)

Language(s) of Instruction

English
