Course Description

The Economics of Information is a critical field that explores how information affects economic decisions, market outcomes, and organizational structures. In this course, students investigate concepts such as information asymmetry, signaling, screening, moral hazard, and adverse selection in order to understand how information and communication may lead to unfavorable outcomes in interactions between agents. Students explore the impact of these phenomena on markets, contracts, auctions, and policy-making, and show how to design institutions that could help to alleviate issues related to asymmetric information.
