6.00

**UCEAP Semester Units**

4.00

## Course Description

This course is focused on the topic of infant and early childhood cognition, and draws on our knowledge of the developing brain and findings from neuroimaging. It begins with an introduction to the field of infant cognitive development, an overview of brain development, and current methodology for studying infants and their brains. The course covers a new topic each week, including both domains of knowledge (objects, number, faces, social reasoning, morality) and mechanisms of early learning (information expectation, information seeking, statistical learning). The course provides a state of the art on cognitive development and focuses on the most recent research that has transformed our understanding of what and how infants learn.
