PLASTIC SURGERY

### **UCEAP Quarter Units**

3.00

#### **UCEAP Semester Units**

2.00

#### **Course Description**

Prerequisites: Fundamentals of anatomy and physiopathology.

The course provides students with a solid knowledge and understanding of the fundamental principles of plastic and reconstructive surgery, with a focus on the management of soft tissue injuries and defects following oncologic resection. Basic concepts related to burn treatment are also introduced. Through theoretical lectures and clinical case discussions, students develop the ability to apply their knowledge in selecting appropriate reconstructive strategies, including skin grafts, local and regional flaps, muscular flaps, and microsurgical techniques. They are also expected to demonstrate independent judgment in evaluating the most effective approaches based on specific clinical contexts.

The course also supports the development of communication skills, as students are encouraged to actively participate in case discussions, articulating their reasoning clearly and effectively. Finally, the course promotes learning skills through an integrated approach that highlights the close relationship between the restoration of function and the aesthetic outcome of reconstructive surgery, with attention to the patient's physical and emotional recovery.
