Course Description

China's economy ranked second worldwide for the past 12 years, while the country is accelerating the opening-up of its financial markets, including the foreign exchange and stock markets, as well as the fixed income market, to global investors. In the first part of this class, we are going to introduce some basic understanding of Chinese financial market with microstructure foundation. The competition among exchanges, development of trading algorithms, and design of robust market systems all requires combining the theory of market microstructure with an understanding of institutional detail of how financial markets work in practice. Liquidity, transaction costs, trading strategies, insider traders, short sellers, high-frequency trading, crashes, market fragmentation, circuit breakers, market design are topics of great interest to finance professors, market participants, policy makers, and sometimes even to the general public. The second part of this course will focus on Chinese stock market, compared with developed stock markets. The general principles are applicable to all markets. By taking this course a student will have an opportunity to learn (1) how trading takes place in financial markets; (2) how economic theories relate to this trading; (3) how legal, regulatory, and ethical considerations shape the trading process.
