### **Course Description**

This course examines the key processes that shape Australia's biophysical environment. It explores Australia's environmental evolution over time and provides foundational knowledge across several environmental science disciplines. The course addresses contemporary environmental issues and highlights the unique challenges facing Australia's environment in the future. Topics include geology, climate and weather, soils, landscape evolution, water, flora, fauna, and biodiversity, with an emphasis on the interdependence of these systems. The course also investigates current issues in Australian environmental science within the context of the continent's environmental history.
