Course Description

This course begins with an overview of the definition of personality and the primary research methods used in personality psychology. It systematically introduces major theoretical perspectives, including psychoanalytic approaches, phenomenological and humanistic theories, trait theories, and contemporary social-cognitive, cultural, and neurobiological perspectives. Across different course units, the instructor incorporates recent data science and neuroscience research related to personality, drawing in part from the instructor's own ongoing work in these areas. In the research project component, students engage in collaborative interactions with AI tools (LLMs). Through this process, students not only learn how to use AI to deepen their understanding of theoretical frameworks, but also enhance their creativity and competence in applying personality theories to empirical research.
